Laporan Praktik React CRUD

Genre

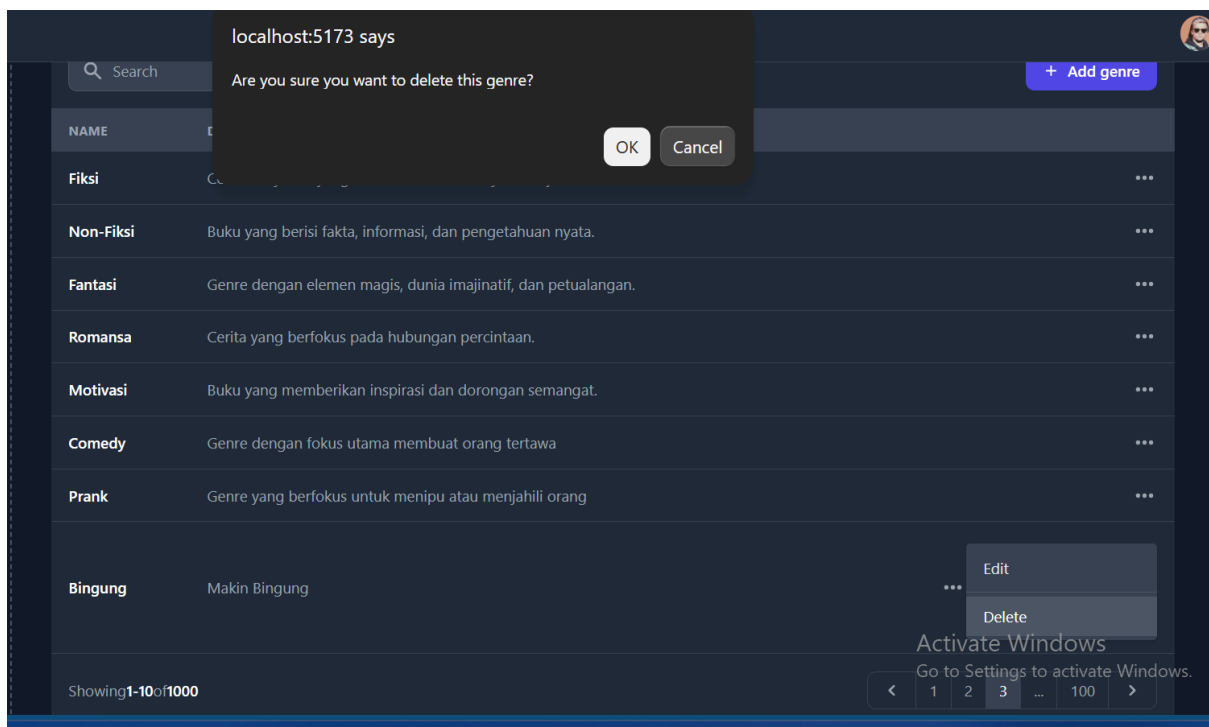

The screenshot shows two files in a VS Code editor. The left file, `AdminGenres.js`, contains the `AdminGenres` component. It uses `useState` for `genres`, `openDropdownId`, and `setOpenDropdownId`. It includes a `useEffect` to fetch genres on mount and a `toggleDropdown` function. The `handleDelete` function shows a confirmation dialog before deleting a genre. The right file, `GenreEdit.js`, contains the `GenreEdit` component. It uses `useParams` to get the genre ID and `useForm` for editing. It includes a `handleChange` function for form updates and a `handleSubmit` function to save changes. Both files use `fetchData` to retrieve genre information from an API.
